

Trinzo AI Hub: Back-Office Assistant Blueprint

The Strategy: The 80/10/10 "Super-Operator" Model

To collapse six siloed back-office functions into a single manageable dashboard, we are building specialized AI assistants. These assistants act as the "80%" execution layer. They handle data ingestion, structuring, and drafting. The human operator provides the initial "10%" (trigger/context) and the final "10%" (review/approval/client-facing delivery).

This architecture allows a single coordinator to manage **Operations, Marketing, and R&D Governance** simultaneously, freeing up their capacity to transition from internal admin to external client relationship management.

The 5 Core AI Assistants

These are the specialized agents to be built in Airia.ai, prioritized by their impact on reducing internal coordination drag.

1. The Meeting & Action Orchestrator

Function Replaced: Project Coordination & Admin Follow-ups **The Problem:** The Hub runs on a heavy cadence of daily/weekly syncs. Hours are lost manually capturing actions, chasing updates, and transferring notes between Teams and Asana.

- **What the AI Assistant Does (The 80%):** Automatically ingests Teams meeting transcripts. Uses Claude/GPT to format standard meeting minutes, extract specific action items, identify tentative owners, and queue these as draft tasks in Asana.
- **What the Human Does (The 10%):** Reviews the dashboard queue. Adjusts task nuance if needed, confirms assignees, and clicks "Approve."
- **Client-Facing ROI:** The operator no longer spends 2 hours a day typing up notes. They can instead join client calls as a delivery coordinator, knowing the internal admin is drafting itself.

2. The Project Status (RAG) Generator

Function Replaced: Delivery Support & Internal Reporting **The Problem:** Compiling bi-weekly RAG (Red/Amber/Green) reports for multiple AI initiatives requires digging through disparate

systems to manually assess project health.

- **What the AI Assistant Does (The 80%):** On a bi-weekly trigger, the AI pulls live data from Asana, SharePoint folders, and recent meeting transcripts. It drafts a comprehensive RAG status report for each active project (e.g., ARIA, LUCE, Audit Tool), flagging delayed tasks in "Amber" or "Red."
- **What the Human Does (The 10%):** Reads the AI-drafted report, adds strategic commentary or context that the data might miss, and approves distribution to stakeholders.
- **Client-Facing ROI:** Reporting becomes a 10-minute review exercise rather than a half-day data-gathering chore.

3. The EI Grant Compliance Tracker

Function Replaced: Governance, Finance Support, & Audit Readiness **The Problem:** Ensuring every R&D activity is captured for the Enterprise Ireland tax credit is critical but heavily administrative. If it isn't documented, it didn't happen.

- **What the AI Assistant Does (The 80%):** Listens to system activity across designated R&D channels. It structures notes, commits code logs, and meeting outcomes into a GxP-standard activity log. It cross-references outputs against required work packages and highlights missing evidence.
- **What the Human Does (The 10%):** Verifies the daily/weekly log entries in the dashboard. Investigates any "missing evidence" flags the AI raises.
- **Client-Facing ROI:** De-risks the 55–67.5% R&D tax credit recovery with zero manual data entry, allowing the team to focus on building the product for clients rather than justifying the build to auditors.

4. The Content Distribution Flywheel

Function Replaced: Marketing Execution & Social Media Scheduling **The Problem:** Turning a great strategic webinar or playbook into actual market presence requires tedious chopping, formatting, and scheduling across multiple platforms.

- **What the AI Assistant Does (The 80%):** Takes a core piece of content (e.g., a video file or a whitepaper draft). Chops it into five optimized LinkedIn posts, a draft email newsletter, and internal Metronome updates. It queues them all with suggested publishing dates.
- **What the Human Does (The 10%):** Reviews the tone of the drafts, edits for personal voice, and hits "Schedule."
- **Client-Facing ROI:** One person acts as a full marketing department in 30 minutes a week. The saved time is immediately reallocated to following up directly with the high-

quality leads generated by the content.

5. The Contractor SLA Manager

Function Replaced: Vendor Management & HR Coordination **The Problem:** With a fractional bench of technical contractors (AI Engineers, Regulatory SMEs), keeping track of sprint deliverables, SLAs, and briefs is a full-time job.

- **What the AI Assistant Does (The 80%):** Automatically drafts contractor sprint briefs based on project specs. Tracks submitted deliverables against agreed timelines in SharePoint. Flags if a contractor is falling behind SLA or if an invoice doesn't match the tracked output.
 - **What the Human Does (The 10%):** Adds specific context to the AI-generated brief before sending. Decides whether to escalate or grant extensions when the AI flags an SLA breach.
 - **Client-Facing ROI:** Automates the "wrangling" of external talent, ensuring the internal team can focus on how those deliverables integrate into final client solutions.
-

The Dashboard Experience (Bringing it Together)

By building these five specific assistants, the Human Operator does not log into five different tools. They log into a **single Airia-powered web dashboard**.

Their morning looks like this:

1. **Approve** 4 tasks extracted from yesterday's client sync.
2. **Review** the EI grant log for yesterday and clear 1 flagged item.
3. **Approve** 3 LinkedIn posts generated from last week's webinar.
4. **Send** the drafted RAG report to the leadership team.

Result: Operations, Marketing, and Governance are handled by 10:00 AM. The rest of the day is spent interfacing with clients, pushing strategic initiatives, and driving revenue.
